Corrpro BullseyeSM *The most accurate approach to retrofitting aboveground storage tanks*

The Corrpro horizontal directionally drilled (HDD) BullseyeSM system has proven to be an effective and dependable way of offering thorough distribution of soil side cathodic protection current to existing above ground storage tank (AST) floors. This efficient, low maintenance system can be easily contoured to site circumstances and offers company answers to difficult under structure cathodic protection.

To initiate or enhance various cathodic protection requirements, our HDD service is available for a wide variety of applications and innovative installations; including AC Mitigation and Environmental Remediation. Our drill crews have the essential experience of installations throughout the continental United States and Alaska. These horizontal efforts have been safely executed at all concerned levels encompassing most major oil and gas companies as well as several high security clearance facilities.

For more information on our installation capabilities and achievements, please contact Corrpro at (330) 723-5082 and ask for your regional sales representative or the horizontal directional drilling specialist at extension 1438.
